

# Upright Digits and Punctuation in Computer Modern Italic

Sergei V. Znamenskii<sup>\*†</sup>

## Abstract

Computer Modern text italic fonts have been modified in the following manner: all punctuation and digits are unslanted, and the corresponding italic corrections added as kerning. Replacement of cmti\* fonts by cmtiup\* simplifies typesetting of mathematical texts.

## Preface

There is a well-known problem with scientific typesetting in  $\text{\TeX}$ : the unslanted digits and punctuation in mathematical formulas are in a terrible dissonance with the slanted digits and in italic text such as theorems and lemmas.

User guides for  $\mathcal{AM}\mathcal{S}$ - $\text{\TeX}$  and  $\mathcal{AM}\mathcal{S}$ - $\text{\LaTeX}$  macro packages recommend uprighting digits and punctuation using the macro (`\rom{}`) which makes its argument unslanted and adds the italic correction before it. This approach does not give the perfect solution:

- This markup is not style independent.
- This markup requires extra work.
- The proper italic correction should sometimes be improved manually (*I*, *but I!*).
- It is too easy to miss some comma or semicolon especially while copying sentences from other text.

An italic font with unslanted punctuation seems to provide the better solution than the special text markup.

In order to keep backward compatibility, the new font have to differ from the standard computern modern italic in just the two aspects:

1. All digits and punctuation must be unslanted;
2. There must be special kerning to compensate for italic correction.

The package contains the proposed solution support for CM italic, METAFONT sources (possibly minimal modification of `cmti*.mf` sources) for systems without virtual font support, virtual fonts (combining text from `cmti*` and punctuation from `cmr*`) to use with type1 CM fonts and package for  $\text{\LaTeX} 2\epsilon$  users.

## 1 User Guide

### 1.1 Installation

To install the fonts on a TDS-compliant system just unpack the file `cmtiup.tds.zip` in your  $\text{\TeX} \text{MF}$  tree and update the file names database.

## 1.2 Usage

The package does not need any changes in `.map` or `.cfg` files. If you use Computer Modern fonts in Type 1 format, the new fonts will be used in the same format too. If you use them in Metafont format, the new fonts will be in this format.

To use the fonts in plain  $\text{\TeX}$  or  $\mathcal{AM}\mathcal{S}-\text{\TeX}$ , just load it as

```
\font\upit = cmtiup10
```

and replace `\it` by `\upit` in your document.

In  $\mathcal{AM}\mathcal{S}-\text{\TeX}$  with `amsppt` you alternatively can use

```
\font\proclaimfont = cmtiup10
```

To use the package in  $\text{\LaTeX}$ , just say

```
\usepackage{cmtiup}
```

## 2 Identification

We start with the declaration who we are. Most `.dtx` files put driver code in a separate driver file `.drv`. We roll this code into the main file, and use the pseudo-guard `<gobble>` for it.

```
1 <package>\NeedsTeXFormat{LaTeX2e}
2 <*gobble>
3 \ProvidesFile{cmtiup.dtx}
4 </gobble>
5 <package>\ProvidesPackage{cmtiup.sty}
6 <*gobble | package>
7 [2010/11/19 v1.3a Upright Digits and Punctuation in Computer Modern Italic]
8 </gobble | package>
```

And the driver code:

```
9 <*gobble>
10 \documentclass{ltxdoc}
11 \usepackage{booktabs,amsmath}
12 \usepackage{url,txnames}
13 \newcommand{\FileName}[1]{\hbox{\ttfamily#1}}
14 \usepackage[breaklinks,colorlinks,linkcolor=black,citecolor=black,
15             pagecolor=black,urlcolor=black,hyperindex=false]{hyperref}
16 \PageIndex
17 \CodelineIndex
18 \RecordChanges
19 \EnableCrossrefs
20 \begin{document}
21   \DocInput{cmtiup.dtx}
22 \end{document}
23 </gobble>
```

## 6 Virtual fonts Properties List files

After running metafont on `cmtiup*.mf`, I have got the `cmtiup*.pl` file by applying `tftopl` program to corresponding `cmtiup.tfm`. This file has been edited by script to get a proper `cmtiup*.vpl` file with correct charwidhts:

### 6.1 File `cmtiup7.vpl`
